

You will need to implement a status mgmt. system.

General:

- 1. Our server receives employee status changes
- 2. Rest server
- 3. Status can be one of the following:
 - a. Working
 - b. OnVacation
 - c. LunchTime
 - d. BusinessTrip
- 4. Example call:

Get - <http://localhost:8000/users>

Post - <http://localhost:8000/users/:userId> example body: { status: "Working" }

Where userId is the user identifier

Environment:

- 1. Attached server.txt file that you can use in order to run a basic express server (full-stack developer should implement the server yourself).
- 2. Please create a react app and make sure you have basic connectivity with the server

Requirements:

- 1. Enable the user to see a list of all employees
- 2. Enable the user to filter the list based on status
- 3. Enable the user to search the list of employees
- 4. Changing the status and applying should update the user status
- 5. The create new user modal doesn't do anything, you can just close it on clicking "Create" or "Cancel". Only English alphabetical characters should be allowed in the input.

Notes:

- 1. The system should be working as expected and convenient
- 2. Keep clean code and proper functionality
- 3. Try to be as pixel perfect as you can (no need to measure pixels from the PDF but try to nail the style)

Bonus:

Try to optimize your application rendering
